Configure Domain Name Server:
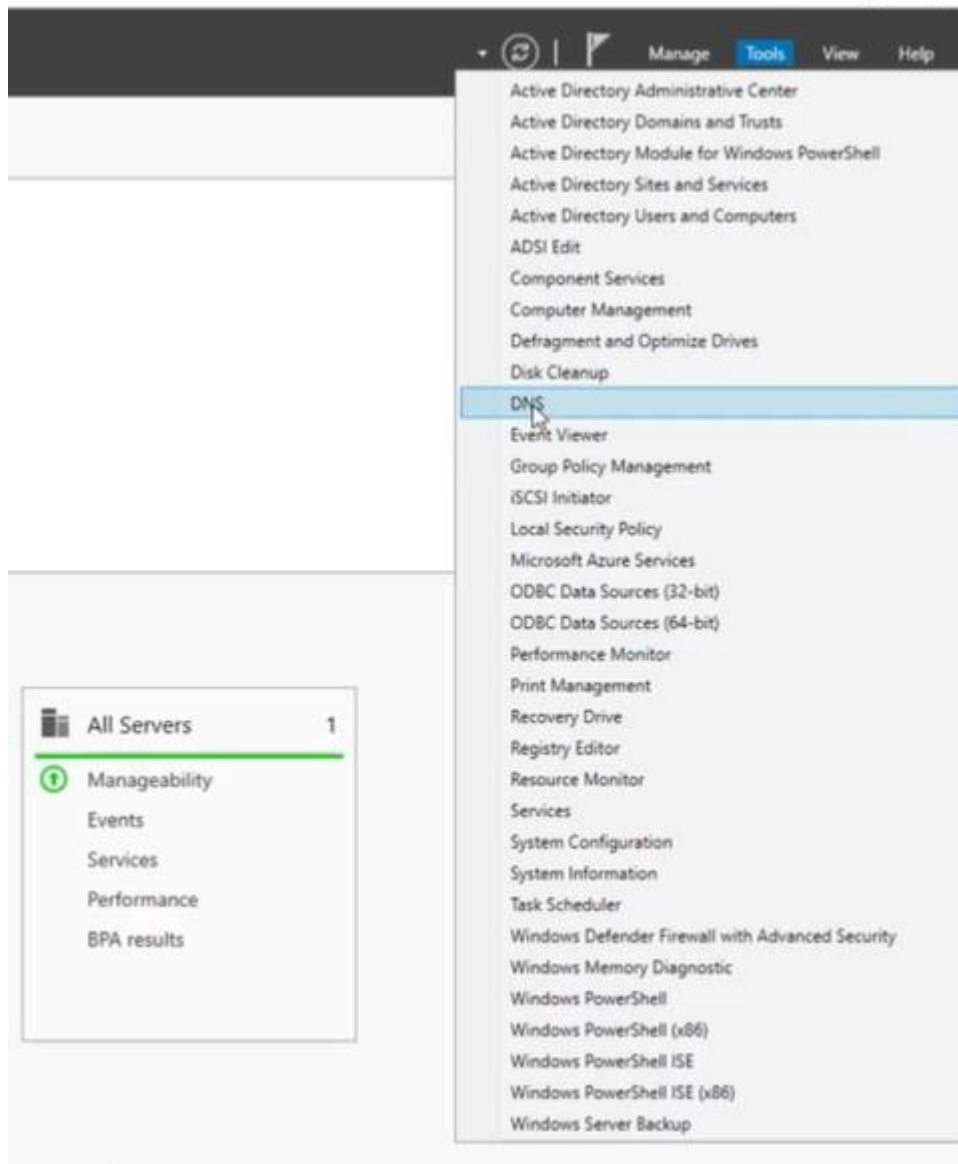

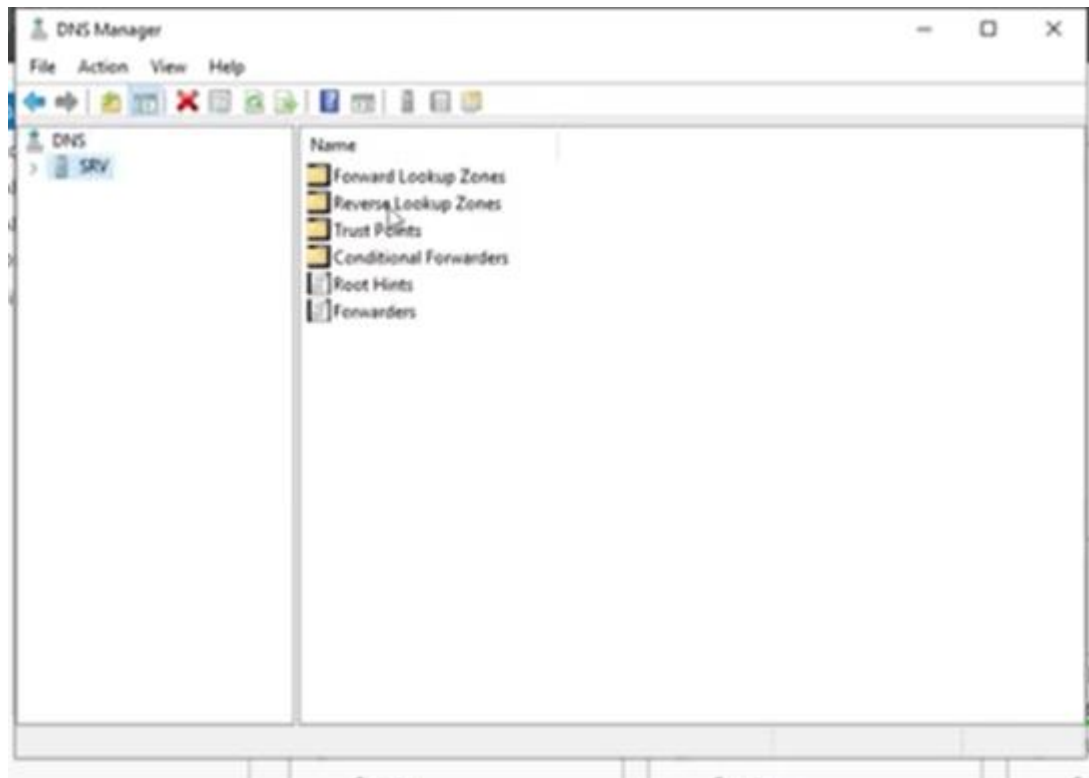

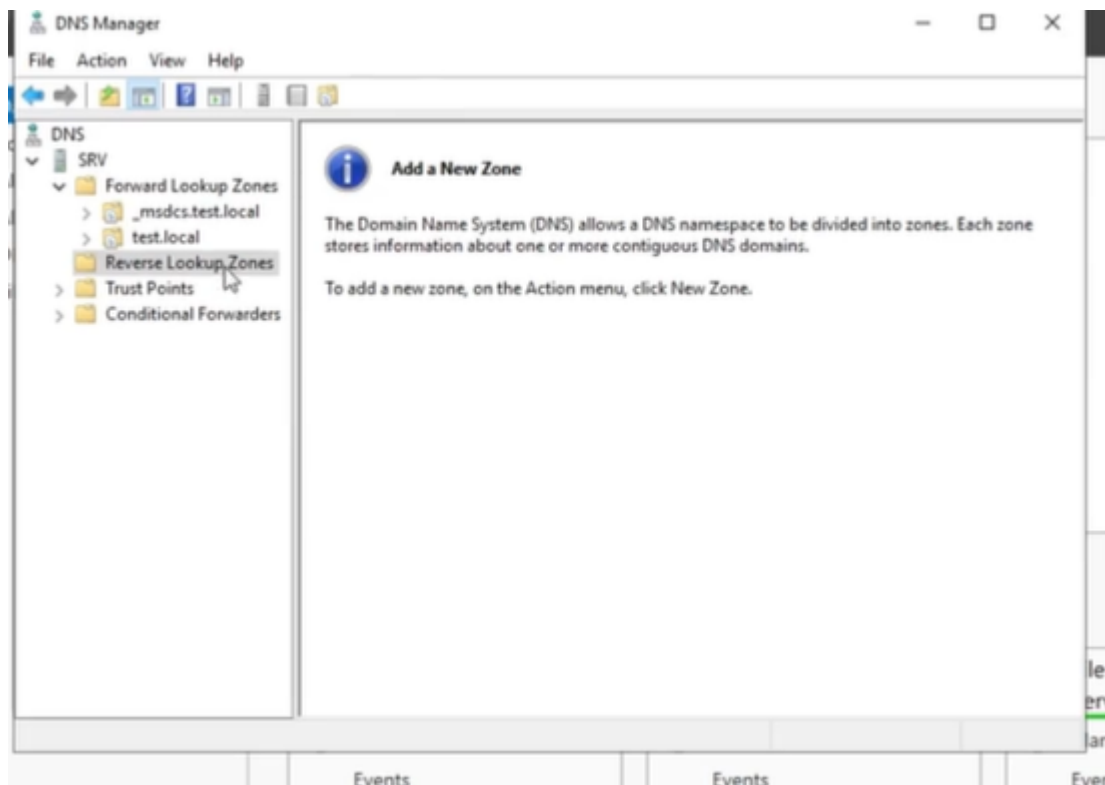

- Go to server manager
- Click on tools and then DNS

- When DNS is open

- Forwards lookup zones is configure but reverse lookup zones is not configure, so do it.

- So configure it
- Click on reverse lookup and select new zone.

- Click next

- Select primary zone and next

- Next

- Again next

- In next step write only network ID of your network according to lab

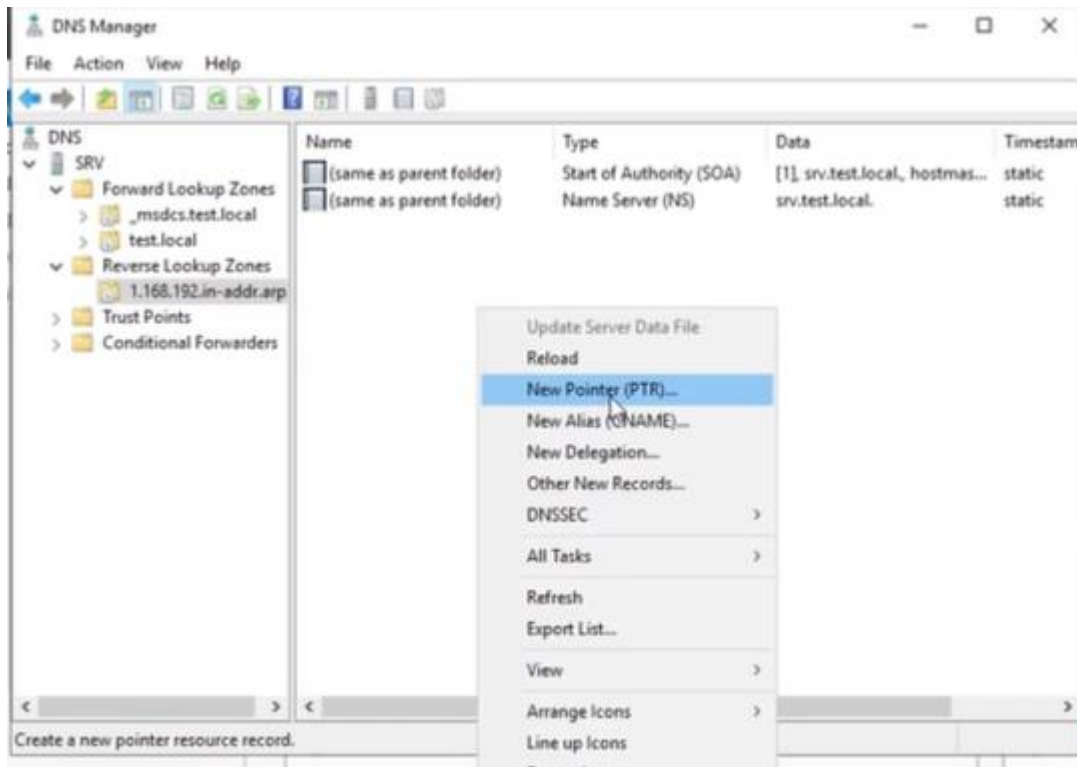

- Allow dynamic updates and then next
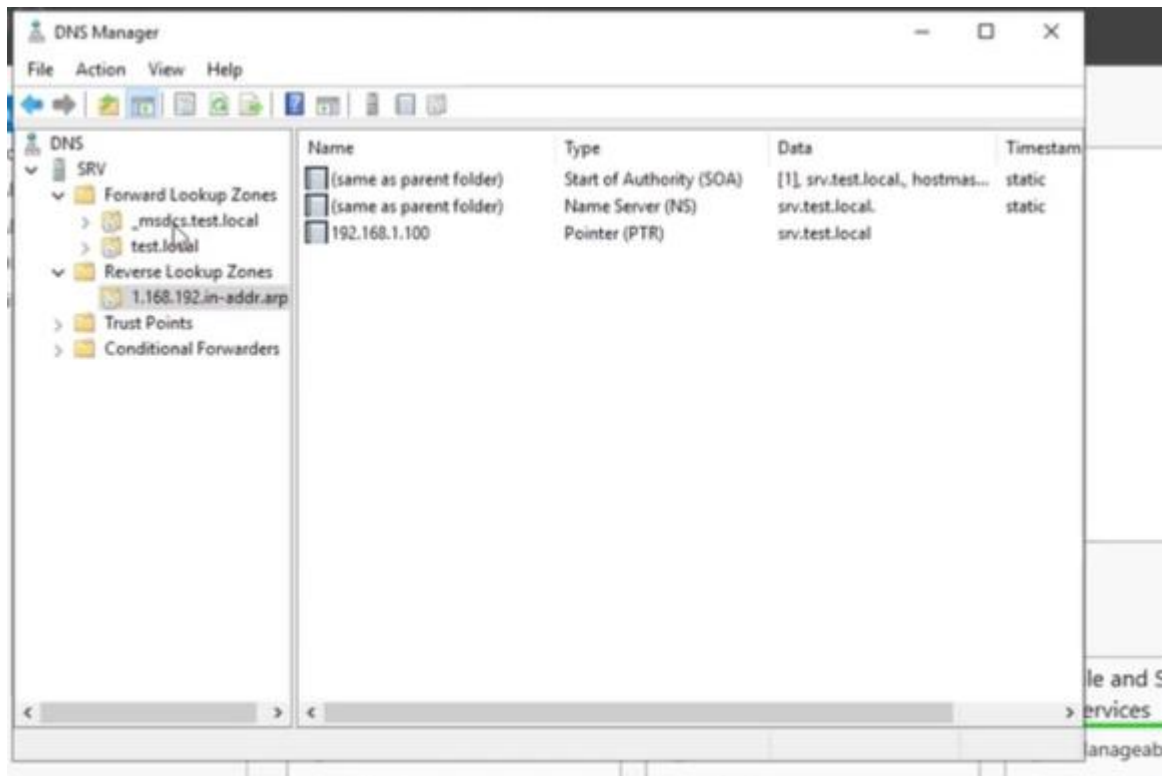

- Then finish it

- Reverse lookup zone configure but here not record of SRV (server machine)
- For this right click and select new pointer option

- Give complete ip address of machine according to lab setup 192.168.1.100
- Set location to SRV from test.local

- Now DNS have in both forward and reverse

- For verification do the following step

- Right click on SRV

- Select option launch nslookup

- If no error here it mean it work correctly

.

- If here ipv6 is showing then disable it .
